Installation with access ramps is ideal when there is enough space to maneuver in and out of the scale, the necessary distance for maneuvers is 223ft additional to the length of the scale (19.6ft length is estimated for each ramp + 92m for the turning radius in simple trucks and with articulation in a single Box, this for both the entrance and exit of the scale). on the scale of 98.5ftm, an additional 254.3ft is required to the length of the scale (19.6ft length is estimated for each ramp + 157.5ft for the turning radius of double Box trucks (FULL), this for both the entrance and the exit of the scale).
